

The use of Pol(and Rec(

This resource was written by Derek Smith with the support of CASIO New Zealand. It may be freely distributed but remains the intellectual property of the author and CASIO.

Trigonometry - a branch of mathematics that studies relationships involving lengths and angles of triangles.

The Coordinate Plane - points are placed on the "coordinate plane". It has two axes - one running horizontally called the 'x-axis', the another at right angles (vertically) called the 'y-axis'. The point where the axes cross is called the **origin** and is where both x and y are zero, with coordinates (0,0). Point A has coordinates (20,15).

Use of Pol(

Example 1: To find the length of the hypotenuse, and the angle the point (1,1) makes with the positive x-axis, measured from (0,0), use **Pol(** [polar coordinates]. To access **Pol(**, use [SHIFT] then [+]. The comma is retrieved using [SHIFT] then [)].

```
Pol(1,1)
```

Once **Pol(1,1)** has been entered press [=] to find the length labeled 'r', and angle labeled θ .

```
Pol(1,1)
r=1.414213562,θ▶
```

To retrieve the value of θ if you see an arrow pointing to the right, ▶ then press the right 'REPLAY' arrow for θ to appear on screen.

```
Pol(1,1)
◀ 414213562,θ=45
```

Here $r = 1.414$ (3 d.p.) metric units and $\theta = 45^\circ$.

Example 2: Find the length of the hypotenuse, and the angle the point (1,4) makes with the positive x-axis, measured from (0,0).

```
Pol(1,4)
r=4.123105626,θ▶
```

```
Pol(1,4)
◀,θ=75.96375653
```

Here $r = 4.123$ (3 d.p.) metric units and $\theta = 75.964^\circ$ (3 d.p.).

Note: $\text{Pol}(x,y)^2$ gives you the length of the hypotenuse squared, $x^2 + y^2 = h^2$.

```
Pol(1,4)^2
```

```
Pol(1,4)^2
17
```

Use of Rec(

If you know the angle and the hypotenuse length then you can calculate the horizontal and vertical lengths of the triangle.

Example: If $r = \sqrt{2}$ metric units and $\theta = 45^\circ$, what are the horizontal and vertical lengths of the triangle?

Use **Rec(** [rectangular coordinates]. To access **Rec(**, use [SHIFT] then [-]. The comma is retrieved using [SHIFT] then [)]. Once entered press [=].

```
Rec(√2,45)
X=1,Y=1
```

Here the horizontal length (x) = 1 metric unit and vertical length (y) = 1 metric unit.
